

Module Details	
Module Title:	Mechanics of Machines and Vibration
Module Code:	MAE5011-B
Academic Year:	2019-20
Credit Rating:	20
School:	Department of Mechanical and Energy Systems Engineering
Subject Area:	Mechanical and Automotive Engineering
FHEQ Level:	FHEQ Level 5
Pre-requisites:	
Co-requisites:	

Contact Hours	
Type	Hours
Lectures	48
Tutorials	24
Laboratory	12
Directed Study	116

Availability	
Occurrence	Location / Period
BDA	University of Bradford / Academic Year (Sept - May)

Module Aims
(1) To evaluate the concepts of a general three-dimensional stress and strain state and to relate these concepts to the behaviour of actual materials and structural elements. (2) To establish knowledge of the concepts, design, analysis and application of machine dynamics (3) To be able to use Adams software to analyse and design dynamics of mechanical systems.

Outline Syllabus
On Statics: Fundamental assumptions of solid mechanics. Stress state; principal stresses, maximum shear

stress, two-dimensional stress states, plane stress and plane strain. Mohr's circle of stress. Torsion - the torsion equation. Work of external loads. Total potential energy. Strain energy methods. Unit load method for calculating deflections. Thick cylinder. Elasticity and plasticity. Yield criteria and their application. Buckling instabilities - the Euler criterion. Brittle and ductile behaviour. Fundamentals of fracture mechanics - stress intensity, strain energy release rate, plastic zone size.

On Dynamics:

- (1) Planar kinematics of rigid bodies: translation; rotation about a fixed point; time derivatives of vectors, general motion; relative motion; instantaneous centre, gears motion, sliding motion;
- (2) Kinetics of rigid bodies: moments of inertia; equations of motion; general plane motion; work & energy; impulse and momentum.
- (3) Three dimensional analysis of rigid body motion: rotation; general motion; relative motion; angular momentum; gyroscopic motion.
- (4) Machines dynamics analysis using ADAMS tools: dynamic simulation techniques; linkage design, joints and motion constraints, design and analysis of machines and systems dynamics

On Vibration

- (1) Free Vibration of Single Degree of freedom system

Learning Outcomes

1	Critically evaluate the fundamental principles of machines design;
2	Critically evaluate the principles of dynamic analysis and vibration analysis;
3	Use Adams software to model and analyse a dynamics performance of machines.

Learning, Teaching and Assessment Strategy

The following strategies are used in teaching this module

- (1) Lectures. Class-based interactive lectures are used to demonstrate the principles of stress analysis and dynamic analysis. Power-points and videos will be used in lectures to make them easy to understand. Our research results will be combined to teaching to inspire students in research.
- (2) Tutorials. Three methods are used in tutorial sessions. First, we will answer student questions; secondly, students will be divided into small groups to answer some examples; third, some examples will be demonstrated to support the understanding of knowledge. Sometimes, we encourage students to demonstrate part of examples to improve their presentation skills.
- (3) Lab sessions. Adams software will be taught and used for students to create some complex dynamic system. Research-based strategy will be applied. Students need to do some research and complete their designs, then use Adams software is used to solve their problems.

The assessment of this modules will include

- (1) Formative assessments to test the understanding of knowledge of machines. There is one formative assessment in each semester. Formative feedbacks will be given after exams.
- (2) Reports of course work. Students are divided into groups to design a machine and develop their models by using Adams software. Students will make an informal presentation and some feedback will be given.

This module satisfies the below Learning Outcomes as specified by the Accreditation of Higher Education Programmes: Third Edition (AHEP3) as published by The Engineering Council in-line with the UK Standard for Professional Engineering Competence (UK-SPEC). These outcomes

specify six key areas of learning: Science and Mathematics (SM), Engineering Analysis (EA), Design (D), Economic, Legal, Social, Ethical and Environmental Context (EL), Engineering Practice (P) and Additional General Skills (G).
 SM1b, SM3b, EA1b, EA2, EA4b, D2, D6, P1, P3, P4, P11b, G1, G3b, SM1m, EA1m, EA4m, EA5m.
 Further details of these learning outcomes can be found at <https://www.engc.org.uk/>.

Mode of Assessment				
Type	Method	Description	Length	Weighting
Summative	Examination - closed book	Students required to answer 4 questions from 6 (Statics)	2 hours	50%
Summative	Examination - closed book	Students required to answer 3 questions from 5 (Dynamics and Vibration)	2 hours	30%
Referral	Examination - closed book	Students required to answer 4 questions from 6 (3 Statics, 3 Dynamics and Vibration)	2 hours	100%
Summative	Coursework	Group report based on ADAMS simulation		20%

Reading List
To access the reading list for this module, please visit https://bradford.rl.talis.com/index.html .

Please note:

This module descriptor has been published in advance of the academic year to which it applies. Every effort has been made to ensure that the information is accurate at the time of publication, but minor changes may occur given the interval between publishing and commencement of teaching. Upon commencement of the module, students will receive a handbook with further detail about the module and any changes will be discussed and/or communicated at this point.
